FLANGES & ACCESORIES

FOR SALE

Products: Flanges

A flange is a forged or cast ring of steel designed to connect sections of pipe or join pipe to a pressure Vessel, pump or any other integral flanges assembly.

Flanges are joined to each other by bolting and joined to the piping system by welding or threading.

There are many different flange standards to be found worldwide. To allow easy functionality and inter-changeability, these are designed to have standardised dimensions. Common world standards include ASA/ANSI/ASME (USA), PN/DIN (European), BS10 (British/Australian), and JIS/KS (Japanese/Korean).

In most cases these are not interchangeable (e.g. an ANSI/ASME flange will not mate against a JIS flange). Further, many of the flanges in each standard are divided into "pressure classes", allowing flanges to be capable of taking different pressure ratings. Again these are not generally interchangeable (e.g. an ANSI/ASME 150 will not mate with an ANSI/ASME 300).

These pressure classes also have differing pressure and temperature ratings for different materials. Unique pressure classes for piping can also be developed for a process plant or power generating station; these may be specific to the corporation,

Slip-On Flanges

The flange is slipped over the pipe and then fillet welded both inside and outside to provide sufficient strength and prevent leakage. This flange is used in preference to weld necks by many users because of its lower cost and the fact that less accuracy is required when cutting pipe to length. Slip-on Flanges are easy to use in fabricated applications.

Blind Flanges

This is a flange without a bore and is used to shut off / blank off a piping system or vessel opening. It also permits easy access to vessels or piping systems for inspection purposes. Blind flange can be supplied with or without hubs at the manufacturers option. It is sometimes referred to as a blanking flange.

Weld-Neck Flanges

This flange is circumferentially welded into the system at its neck. It is designed to be joined to a piping system by butt welding. It is relatively expensive because of its long neck, but is preferred for high stress applications. The neck, or hub transmits stresses to the base of the hub to the wall thickness at the butt weld, providing important reinforcement of the flange. The bore of the flange matches the bore of the pipe, reducing turbulence and erosion. The weld-neck is therefore favoured in critical applications.

Threaded Flanges

This is referred to as either threaded or screwed. This is similar to a slip-on flange in outline, but the bore is threaded, thus enabling assembly without welding. This obviously limits its application to relatively low pressure piping systems. The flange may be welded around the joint after assembly, but this is not considered a satisfactory method of increasing its applications. Usually no welding is required.

engineering procurement and construction (EPC) contractor, or the process plant owner. The ANSI/ASME pressure classes for Flat-Face flanges are 125# and 250#. The classes for Ring-Joint, Tongue & Groove, and Raised-Face flanges are 150#, 300#, (400# - unusual), 600#, 900#, 1500#, and 2500#.

The flange faces are also made to standardized dimensions and are typically "flat face", "raised face", "tongue and groove", or "ring joint" styles, although other obscure styles are possible.

Flange designs are available as "weld neck", "slip-on", "lap joint", "socket weld", "threaded", and also "blind".

The most common facings machined on flanges are:

- Raised face, 1/16 inch for 150lb and 300lb, 1/4 inch for 400lb and heavier.
- Flat face, for 150lb and 300lb only, other may be flat face on request.
- Ring type joint, may be applied to all pressure ratings.

Socket Weld Flanges

This is similar to a slip-on flange in outline, but the bore is counter-bored to accept pipe before being fillet welded. The diameter of the remaining bore is the same as the inside diameter of the pipe therefore giving good flow characteristics. The flange is attached to the pipe by a fillet weld around the hub of the flange. An optional interval weld may be applied in high stress applications. Its biggest use is in high pressure systems such as hydraulic and steam lines.

Lap-Joint Flanges

This is again similar to a slip-on flange, but it has a radius at the intersection of the bore and the flange face to accommodate a lap stub end. The face on the stub end forms the gasket face on the flange. This type of flange is used in low-pressure applications where section of piping systems need to be dismantled quickly and easily assembled for inspection or replacement.

Orifice Flanges

The function of an orifice flange is to provide access to a line for metering of gases or liquids. An orifice plate is clamped between a pair of flanges when installed in a line and the whole assembly is referred to as an orifice flange union. Jack-screws within the assembly facilitate removal of the orifice plate. The orifice plate, the metering device, consists of a thin plate with a concentric, square edge, circular hole in the center. Two pressure tap-holes are drilled in each flange to measure pressure difference through the orifice.

Groove & Tongue Flanges

The Groove and Tongue faces of these flanges must be matched. One flange face has a raised ring (Tongue) machined onto the flange face while the mating flange has a matching depression (Groove) machined into its face. These are commonly found on pump covers and Valve Bonnets. Tongue and groove joints also have an advantage in that they are self-aligning and act as a reservoir for the adhesive.

Products: Socket Weld Pipe Fittings

A Socket Weld is a pipe attachment detail in which a pipe is inserted into a recessed area of a Valve, fitting or flange. In contrast to buttweld fittings, Socket Weld fittings are mainly used for small pipe diameters (Small Bore Piping) to join pipe to Valves and fittings or to other sections of pipe, fillet-type seal welds be used. Socket-welded Joints construction is a good choice wherever the benefits of high leakage integrity and great structural strength are important design considerations. Fatigue resistance is lower than that in butt-welded construction due to the use of fillet welds and abrupt fitting geometry, but it is still better than that of most mechanical joining methods.

Socket Weld Fittings are family of high pressure fittings are used in various industrial processes.

- They are used for lines conveying flammable, toxic or expensive material where no leakage can be permitted, and for steam 300 to 600 PSI.
- They are used only in conjunction with ASME Pipe and are available in the same size range.
- They are used in areas where pipe-work is permanent and are designed to provide good flow characteristics.

SW Full Coupling	SW Half Coupling	SW Reducing Coupling	SW Cap	SW Union
Termed Coupling, joins pipe two pipe or to a nipple etc	The Half Coupling can be directly welded to the run pipe, to make a branch connection	Joints two different outside diameters of pipe	Seals the end of Pipes	It is a screwed joint design and it consists of three interconnected pieces: two internally threads and a center piece that draws the ends together when rotated. Unions should be screwed tight before the ends are welded to minimize warping of the seats.

Advantages

- The pipe need not be bevelled for weld preparation.
- Temporary tack welding is no needed for alignment, because in principle the fitting ensures proper alignment.
- The weld metal cannot penetrate into the bore of the pipe.
- They can be used in place of threaded fittings, so the risk of leakage is much smaller.
- Radiography is not practical on the fillet weld; therefore correct fitting and welding is crucial. The fillet weld may be inspected by surface examination, magnetic particle (MP), or liquid penetrant (PT) examination methods.
- Construction costs are lower than with butt-welded joints due to the lack of exacting fit-up requirements and elimination of special machining for butt weld end preparation.

Pipe Fitting Capacity / Range: Pipe Fitting products mix includes $\frac{1}{2}$ " to 12".

SW Elbow 45 Degrees

This Elbows make 45 degrees changes of direction in the run of pipe

SW Tee Straight

This Tee makes 90 degrees branch from the main run of pipe

SW Cross

Crosses makes 90° branch from the main run of pipe

SW Reducer Insert

Socket Weld Reducer Inserts enable quick and economic combinations of pipeline reductions to be made using standard Socket Weld fittings

SW Elbow 90 Degrees

It is a screwed joint design and it consists of three interconnected pieces: two internally threads and a centerpiece that draws the ends together when rotated. Unions should be screwed tight before the ends are welded to minimize warping of the seats

Products: Threaded Pipe Fittings

Threaded joints probably represent the oldest method of joining piping systems. Like Socket Weld fittings, threaded fittings are mainly used for small pipe diameters (Small Bore Piping); generally for piping whose nominal diameter is NPS 2 or smaller.

The dimensional standards for taper pipe threads are given in ASME B1.20.1. That document gives all required dimensions including number of threads per inch, pitch diameter, and normal engagement lengths for all pipe diameters.

Threaded piping is commonly used in low-cost, noncritical applications such as domestic water, fire protection, and industrial cooling water systems.

Threaded fittings are normally made of cast gray or malleable iron, cast brass or bronze, or forged alloy and carbon steel.

They are available in three pressure ratings: Class 2000, 3000 and 6000.

Threaded Elbow 90°

Elbow 90°
This Elbows make 90° changes of direction in the run of pipe.

Threaded Elbow 45°

Threaded Elbow 45°
This Elbows make 45° changes of direction in the run of pipe.

Threaded Tee

Tee
This Tee makes 90 degrees branch from the main run of pipe.

Threaded Cross

Crosses makes 90 degrees branch from the main run of pipe.

NPT Thread

All fittings in this section are described, are provided with NPT thread, ASME B1.20.1. The American National Pipe Thread Tapered, is the best known and most widely used connection where the pipe thread provides both the mechanical joint and the hydraulic seal. NPT has a tapered male and female thread which seals with Teflon® tape or jointing compound.

Threaded Full Coupling

Threaded Full Coupling
A Full Coupling, joins pipe two pipe or to a nipple etc.

Threaded Cap (End Cap)

Threaded Cap (End Cap)
Seals the threaded end of pipe.

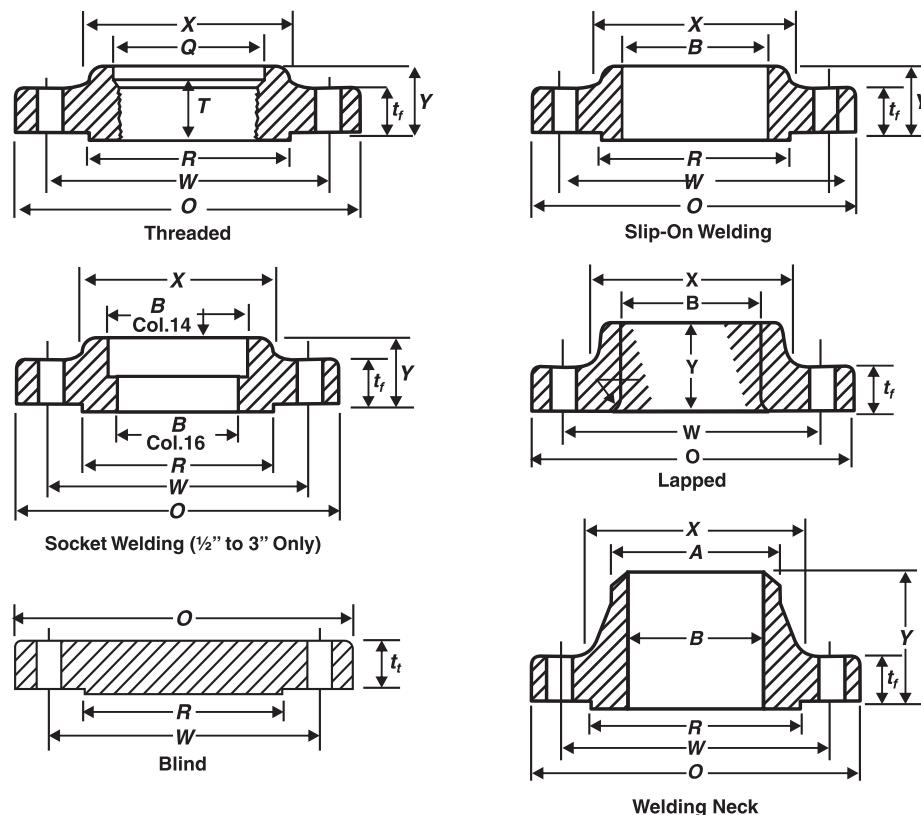

Threaded Half Coupling

Threaded Half Coupling
The Half Coupling can be directly welded to the run pipe, to make a branch connection.

Threaded Union

Unions are primarily used for maintenance and installation purposes. It is a screwed joint design and it consists of three interconnected pieces. Two internally threads and a centerpiece that draws the ends together when rotated.

NOTE: (1) USE CLASS 600 FOR SIZES NPS 1/2 TO NPS 3 1/2 FOR CLASS 400

(2) USE CLASS 1500 FOR SIZES NPS 1/2 TO NPS 2 1/2 FOR CLASS 900

(3) Height of raised portion is equal to the depth of groove dimension E, but is not subjected to the tolerance for E, Former full-face contour may be used.

(4) For ring joints with lapped flanges in Classes 300 and 600, ring and groove number R30 is used instead of R31.

TOLERANCES: E (depth) + 0.4, -0.0 F (width) ± 0.2 P (pitch diameter) ± 0.13 R (radius at bottom) R £ 2 + 0.8, -0.0 R > 2 ± 0.8 23 deg (angle) ± ½ deg

GENERAL TOLERANCES

1. Facings

Required tolerances for various flange and flanged fitting facings are as follows:

- 1.1 Inside and outside diameter of large and small tongue and Groove and female, ± 0.5 mm
- 1.2 Outside diameter, 2.0 mm Raised face, ± 1.0 mm
- 1.3 Outsidiameter, 7.0 mm Raised face, ± 0.5 mm

2. Flange Thickness

Required tolerances for flange thickness are as follows.

NPS \leq 18	$+ 3.0, -0.0$ MM
NPS \leq 20	$+ 5.0, -0.0$ MM

The plus tolerances is applicable to bolting bearing surfaces whether as forged, as cast, spot-faced or back-faced.

3. Welding End Flange Ends and Hubs

3.1 Outside Diameter. Required tolerances for the nominal outside diameter dimension A of figs. Welding end of welding neck flanges are as follow:

NPS \leq 5	$+ 2.0, -1.0$ mm
NPS \leq 6	$+ 4.0, -1.0$ mm

3.2 Inside Diameter. Required tolerances for the nominal inside diameter of welding ends of welding neck flanges and smaller bore of socket welding flanges (dimension B in the referenced figures) are as follows.

NPS \leq 1	$+ 1.0$ mm
12 \leq NPS \leq 18	$+ 1.5$ mm
NPS \leq 20,	$+ 3.0, 1.5$ mm

3.3 Hub Thickness. Despite the tolerances specified for dimensions A andB, the thickness of the hub at the welding end shall not be less than 87½% of the nominal thickness of the Pipe, having an under tolerance of 2.5% for the pipe wall thickness to which the flange is to be attached, or the minimum wall thickness as specified by the purchaser.

4.0 Length Through Hub on Welding Neck Flanges

The required tolerances for the length through hubs on welding neck flanges are as follows.

NPS \leq 4	± 1.5 mm
5 \leq NPS \leq 10	$+ 1.5, -3.0$ mm
NPS \leq 12,	$+ 3.0, mm -5.0$ mm

5.0 Flange Bore

5.1 Lapped, Slip-on, and Socket Welding Flange Bores.

The required tolerances for lapped, slip-on and socket welding flange bores are as follows.

NPS \leq 10	$+ 1.0, -0.0$ mm
NPS \leq 12	$+ 1.5, -0.0$ mm

5.2 Counterbores, Threaded Flanges. The required tolerances for threaded flange counterbores are as follows.

NPS \leq 10	$+ 1.0, -0.0$ mm
NPS \leq 12	$+ 1.5, -0.0$ mm

5.3 Counterbores, Socket Welding Flanges. The required tolerances for socket and counterbores is as follows.

$1\frac{1}{2} \leq$ NPS \leq 3	± 0.25 mm
----------------------------------	---------------

6.0 Drilling and Facing

6.1 Bolt Circle Diameter. The required tolerance for all bolt circle diameters is

± 1.5 mm

6.2 Bolt Hole to Bolt Hole. The required tolerance for the center-to-center of adjecent bolt holes is ± 0.8 mm

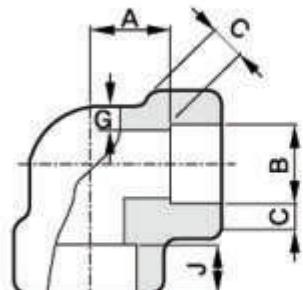

6.3 Bolt Circle Concentricity. The required tolerances for concentricity between the flange bolt circle diameter and machined facing diameters are as follows.

NPS $\leq 2\frac{1}{2}"$	0.8 mm
NPS $\geq 3"$	1.5 mm
